Carbon Capture and Storage

Carbon Capture and Storage, Second Edition, provides a thorough, non-specialist introduction to technologies aimed at reducing greenhouse gas emissions from burning fossil fuels during power generation and other energy-intensive industrial processes, such as steelmaking. Extensively revised and updated, this second edition provides detailed coverage of key carbon dioxide capture methods along with an examination of the most promising techniques for carbon storage. The book opens with an introductory section that provides background regarding the need to reduce greenhouse gas emissions, an overview of carbon capture and storage (CCS) technologies, and a primer in the fundamentals of power generation. The next chapters focus on key carbon capture technologies, including absorption, adsorption, and membrane-based systems, addressing their applications in both the power and non-power sectors. New for the second edition, a dedicated section on geological storage of carbon dioxide follows, with chapters addressing the relevant features, events, and processes (FEP) associated with this scenario. Non-geological storage methods such as ocean storage and storage in terrestrial ecosystems are the subject of the final group of chapters. A chapter on carbon dioxide transportation is also included. This extensively revised and expanded second edition will be a valuable resource for power plant engineers, chemical engineers, geological engineers, environmental engineers, and industrial engineers seeking a concise, yet authoritative one-volume overview of this field. Researchers, consultants, and policy makers entering this discipline also will benefit from this reference. - Provides all-inclusive and authoritative coverage of the major technologies under consideration for carbon capture and storage - Presents information in an approachable format, for those with a scientific or engineering background, as well as non-specialists - Includes a new Part III dedicated to geological storage of carbon dioxide, covering this topic in much more depth (9 chapters compared to 1 in the first edition) - Features revisions and updates to all chapters - Includes new sections or expanded content on: chemical looping/calcium looping; life-cycle GHG assessment of CCS technologies; non-power industries (e.g. including pulp/paper alongside ones already covered); carbon negative technologies (e.g. BECCS); gas-fired power plants; biomass and waste co-firing; and hydrate-based capture

Available online: <https://pub.norden.org/temanord2023-521/> All Nordic countries have set ambitious targets to achieve net-zero greenhouse gas emissions through various national goals and legislation. Carbon Capture and Storage (CCS) has a key role in strategies to achieve net-zero emissions through mitigating emissions from fossil fuels and removing CO₂ permanently from the atmosphere. This project aimed to analyse regulatory aspects that are relevant for deployment of CCS-based mitigation options in a Nordic context. The report identifies similarities and differences between the Nordic countries concerning CCS regulation, barriers to CCS deployment due to regulatory frameworks, and currently ongoing regulatory development aimed at promoting responsible CCS deployment. Recommendations are provided concerning areas where further development, coordination, and capacity building might be prioritised by the Nordic countries.

Comprehensive Treatise on Central Cord Syndrome (CCS)

Germany wishes to cut its greenhouse gas emissions by 80 to 95 per cent by 2050. However, despite the success to date, the measures which have already been planned and implemented are not sufficient for achieving this ambitious goal. In addition to the energy sector, the largest source of greenhouse gas emissions, German industry is also responsible for releasing considerable volumes of global warming gases. In its Climate Action Plan 2050, the Federal Government has for the first time set a sector target for industry. The present acatech POSITION PAPER analyses the options for (re)utilising and storing CO₂ (Carbon Capture and Utilisation (CCU) and Carbon Capture and Storage (CCS)) which come into consideration for reducing greenhouse gas emissions from industrial processes. It is recommended that a wide-ranging public debate about the use of CCU and CCS be conducted in the near future. Only then will it be possible to take account of reservations about CCU and CCS, further develop suitable technology in good time and bring it to market maturity so that the necessary infrastructure can be planned, approved, funded and constructed.

Carbon Capture and Storage (CCS): A Simple Guide to Big Ideas

This work relates different approaches for the modelling of parallel processes. On the one hand there are the so-called "process algebras" or "abstract programming languages" with Milner's Calculus of Communicating Systems (CCS) and the theoretical version of Hoare's Communicating Sequential Processes (CSP) as main representatives. On the other hand there are machine models, i.e. the classical finite state automata (transition systems), for which, however, more discriminating notions of equivalence than equality of languages are used; and secondly, there are differently powerful types of Petri nets, namely safe and general (place/transition) nets respectively, and predicate/transition nets. Within a uniform framework the syntax and the operational semantics of CCS and TCSP are explained. We consider both, Milner's well-known interleaving semantics, which is based on infinite transition systems, as well as the new distributed semantics introduced by Degano et al., which is based on infinite safe nets. The main part of this work contains three syntax-driven constructions of transition systems, safe nets, and predicate/transition nets respectively. Each of them is accompanied by a proof of consistency. Due to intrinsic limits, which are also investigated here, neither for transition systems and finite nets, nor for general nets does a finite consistent

representation of all CCS and TCSP programs exist. However sublanguages which allow finite representations are discerned. On the other hand the construction of predicate/transition nets is possible for all CCS programs in which every choice and every recursive body starts sequentially.

Carbon Capture and Storage in International Energy Policy and Law identifies the main contemporary regulatory requirements, challenges and opportunities involving CCS from a comparative and interdisciplinary perspective. It draws on the scholarship of renowned researchers across the fields of international energy law and policy to address CCS regulation and its impact on climate change, sustainable development, and related consequences for energy transition. In this vein, the book aims to address issues related to energy, energy justice and climate changes (including CCS technology). Contributors discuss the main challenges and advantages concerning international energy and the forms CCS may contribute to energy security, climate change, adaptation and mitigation of GHG emissions and sustainable development. In this light, the book discusses CCS as a bridge that integrates international energy, climate change and sustainable development. - Covers contemporary regulatory command-and-control and market incentive instruments across the local, regional and/or international spheres in-depth and in comparison - Reviews deregulatory impacts, modern financing of CCS, liability of the involved parties, and pertinent environmental issues - Addresses sociotechnical aspects of CCS and its specific impact on the international arena - Discusses the interplay of carbon capture and storage, renewables and the overall energy transition, current pathways to sustainable development

This book presents the fundamentals of concurrency theory with clarity and rigor. The authors start with the semantic structure, namely labelled transition systems, which provides us with the means and the tools to express processes, to compose them, and to prove properties they enjoy. The rest of the book relies on Milner's Calculus of Communicating Systems, tailored versions of which are used to study various notions of equality between systems, and to investigate in detail the expressive power of the models considered. The authors proceed from very basic results to increasingly complex issues, with many examples and exercises that help to reveal the many subtleties of the topic. The book is suitable for advanced undergraduate and graduate students in computer science and engineering, and scientists engaged with theories of concurrency.
